

Test slide from [attachment 166083](#) as it appears in LO 7.0.3, when file is in odp format:

Same test slide opened in LO after saving in pptx or ppt format:

Based on the right image, this appears to be a widely enlarged part of the clip art, showing a small bit of the DNA helix from some position near either upper left or lower right corner. This would be consistent with showing just a white part of the microscope image.

Opening the file in Microsoft PowerPoint:

- Original odp file shows an empty slide.
- The ppt file appears similar til LO opening the ppt file (the lower of the two screenshots).
- The pptx file opens similarly to the ppt file, except that the object borders are missing. This leaves just a white space in the place of the left object, but a selectable object is present. Right object is a snippet of the DNA helix.
